

## **Appendix 1:**

### **List of Prompts Used**

1. <https://chatgpt.com/share/6874acf9-d20c-8013-9e8a-1874ae62b27c>

The screenshot shows a ChatGPT chat window with a dark background. At the top right, a pink icon of a document with a checkmark is next to the text "test\_gpt\_fyp.pdf" and "PDF" below it. Below this, a grey speech bubble contains a system prompt. The main chat area shows the AI's response, which includes a summary of writing style, tone, and vocabulary from the uploaded PDF. At the bottom center, there is a circular button with a downward arrow.

test\_gpt\_fyp.pdf  
PDF

> You are no longer writing in the typical voice of an AI. Instead, you are to completely emulate the writing style, tone, vocabulary, and structure found in the following text [OR] from the uploaded PDF. Your goal is to write as if you are the same author who wrote that piece.

Understood.

Based on the PDF you've provided, here's a summary of the writing style, tone, and structure used by the author:

**Writing style:**

- Academic but approachable
- Mixes formal structure with clear, readable prose
- Frequent use of definitions and clarifications ("Authentic content here refers to...")
- Sentences tend to be medium-length, not overly dense
- Logical flow with clear signposting between sections

**Tone:**

- Objective, informative
- Encouraging and supportive of language learners
- Slightly persuasive, advocating for the proposed system (LexiFlow)
- Confidence in technological feasibility, grounded in research citations

**Vocabulary:**

- Professional and technical, but avoids excessive jargon
- Regular use of terms from educational theory and software development (e.g., "Input Hypothesis," "Neural Machine Translation," "ASR," "pinyin")
- Repeats key concepts for clarity and reinforcement (e.g., "authentic content," "sentence-level segmentation")

2. <https://chatgpt.com/share/6874ad62-f5ac-8013-9136-c53b753af556>

for my use case diagram my supervisor asked me to add my models into the diagram. this was her comment: "if you have components which you add as API put it as an actor

ASR - OpenAI Whisper?

ML - Seamless M4T?

"

under what stereotype do i add them ? external systems? api? models?

for reference both models will run locally on my system so no external api will be used

Great question — and you're already on the right track by thinking in terms of **stereotypes** and **actors** in a UML Use Case Diagram.

### Your supervisor's suggestion:

*"If you have components which you add as API, put it as an actor."*

Even though the models (e.g., OpenAI Whisper for ASR and SeamlessM4T for ML translation) run **locally**, your system **depends** on them as **external functional components**. In UML terms, that makes them actors — not because they're human users, but because they're **external to your system's logic**, even if they're hosted locally.

### So what stereotype should you use?

#### ✅ Recommended stereotype:

plaintext

📄 Copy ✎ Edit

<<external system>>

This is the most common and UML-appropriate stereotype for models/APIs/tools that interact with your system but are not part of its internal logic, even if they run locally.

You could label them like:
